

SCA channel gates (A2, 30 seeds, test partition). SCA has no spatial term, so these are channel gates, not spatial maps.

Panel (c): each point is one seed. Changing the script id while holding the image fixed moves the gate 3.3% as much as changing the image does. A1's gates cannot see the script by construction; its non-zero value is float32 round-off and is the probe's null check.
